CARE GUIDE FOR METAL PARTIALS

- ▶ Brush your partial with a denture brush or a soft bristle toothbrush to prevent calculus build-up and staining. You may use an ADA approved denture cleanser or mild dishwashing soap. Never use toothpaste as it can be too abrasive for the acrylic.
- ▶ Partial can break if they are dropped! To prevent this, brush partial over a folded towel or a sink filled with water
- ▶ Always keep your partial moist. Without moisture, it could distort the fit.
- ▶ Never leave a metal partial in a soaking solution overnight, as it could tarnish. For overnight soaking, just use water.
- ▶ Be sure if you have precision attachments in your mouth that you are taking proper measures in keeping them clean. If not this will affect the fit of your partial.
- ▶ Never wrap your partial in a tissue or napkin as too many times these get thrown away.
